**1U01DE024448-01, Spoke Project**

**RFA-DE-14-004, FaceBase 2: Craniofacial Development and  
Dysmorphology – Dataset, Tool, and Resource Development**

# Key Personnel

## **Multiple Principal Investigators**

Greg Holmes, Ph.D.

Ethylin Wang Jabs, M.D. (contact)

Harm van Bakel, Ph.D.

(Icahn School of Medicine at Mount Sinai, New York)

## **Co-Investigator**

Michael Donovan, Ph.D., M.D.

(Icahn School of Medicine at Mount Sinai)

## **Subcontract-Principal Investigator**

Steven Potter, Ph.D.

(Cincinnati Children's Hospital Medical Center)

# **Overall Goal**

**To generate comprehensive gene expression atlases of 11 major craniofacial sutures at embryonic stages of the wild-type mouse and craniosynostosis mouse models.**

# Significance

**Suture function is critical for normal craniofacial development**

**Defective/pathologic activity of suture genes can cause craniosynostosis and midface hypoplasia, but the genetic cause in most cases of these conditions is unknown**

**A complete knowledge of suture gene expression would further our understanding of suture function and craniofacial development and aid in predicting genes involved in craniosynostosis and other craniofacial dysplasias**

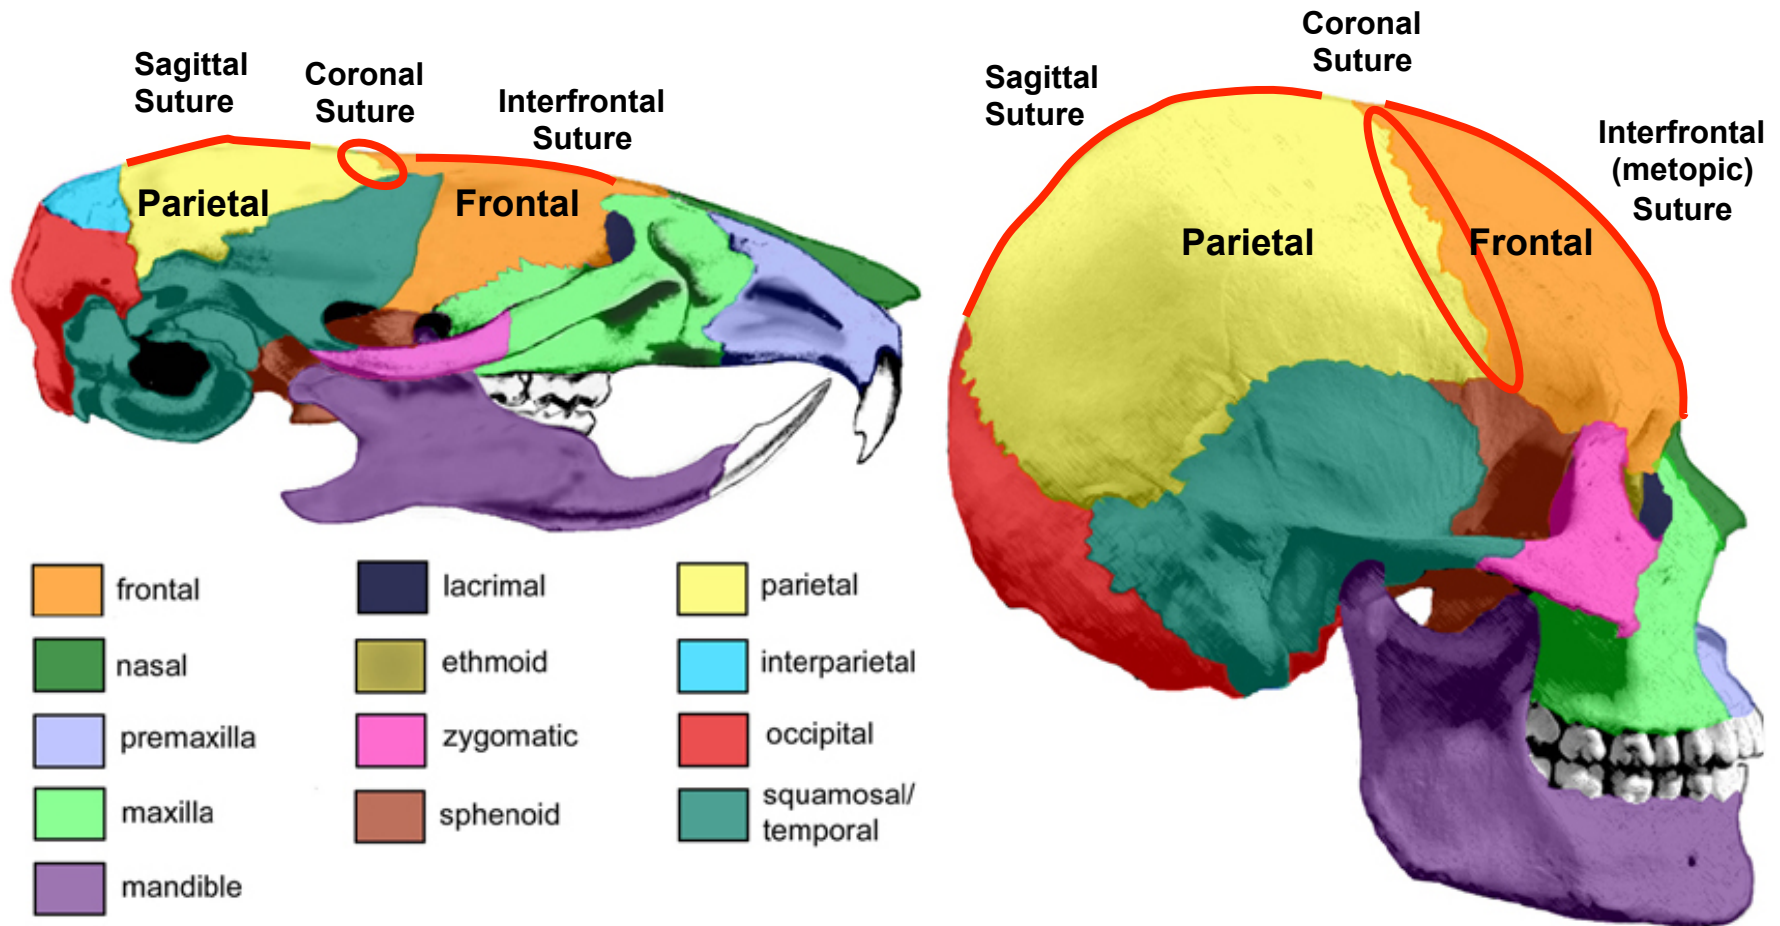

# Specific Aims

**Aim 1:** To isolate the subregions of eleven murine craniofacial sutures using laser capture microdissection (LCM) to create a gene expression atlases at two (or three) embryonic stages.

**Aim 2:** To use next-generation sequencing (NGS) to create gene expression atlases for murine WT (C57BL/6J) craniofacial suture subregions.

**Aim 3:** To use NGS to create gene expression atlases for craniofacial suture subregions in Apert and Saethre-Chotzen mouse models.

# Specific Aims

**Aim 1:** To isolate the subregions of eleven murine craniofacial sutures using laser capture microdissection (LCM) to create a gene expression atlases at two (or three) embryonic stages.

**Aim 2:** To use next-generation sequencing (NGS) to create gene expression atlases for murine WT (C57BL/6J) craniofacial suture subregions.

**Aim 3:** To use NGS to create gene expression atlases for craniofacial suture subregions in Apert and Saethre-Chotzen mouse models.

# Apert *Fgfr2*<sup>+/S252W</sup> Mouse Model

- Coronal suture fusion
- Interfrontal suture wider at P0
- Premaxillary/maxillary and maxillary/palatine fusion initiated by P0, and more extensive facial suture fusion seen postnatally
- *Fgfr2* is extensively expressed in osteogenic fronts/preosteoblasts of craniofacial bones
- All sutures to be assessed at E16.5 and E18.5, and at E14.5 for the coronal suture

# Saethre-Chotzen *Twist1*<sup>+/-</sup> Mouse Model

- Coronal suture fusion
- Interfrontal suture wider at P0
- TWIST1 interacts with the Fgfr2, Ephrin, and Notch pathways in the suture
- The coronal and interfrontal sutures to be assessed at E16.5 and E18.5, and at E14.5 for the coronal suture
